

LEARNING OUTCOMES FOR ELECTRICITY.

You should know that:

Electrical Safety

- 1. Electrical energy can be dangerous.
- 2. Recognise some of the dangers of electricity in the home and outside.

Atoms

- 3. All objects are made up of small particles called atoms.
- 4. Inside each atom there are three small particles called neutrons, protons, and electrons.
- 5. A proton has a positive charge.
- 6. An electron has a negative charge.
- 7. A neutron is neutral or uncharged.

How to make Electricity.

- 8. Electric charge can be collected by rubbing two different surfaces together.
- 9. A Van de Graff Generator produces electric charges.

Electric Current.

- 10. When electric charge moves we call it an electric current.
- 11. Current is a flow of charge (or electrons) around a circuit.
- 12. Materials that allow current through them are called electrical conductors.
- 13. Materials that do not allow current through them are called electrical insulators.
- 14. We use the symbol \mathcal{I} to represent current.
- 15. Current is measured in amperes or amps.
- 16. Current is measured using an ammeter.
- 17. Ammeters are connected in series.
- 18. The symbol for an ammeter is
- *19. For electrons to flow there must be a complete circuit.*
- 20. A multimeter can be set up to measure current, resistance or voltage.
- 21. When a multimeter is set up to measure current we call it an ammeter.

Resistance

- 22. Some materials have a high resistance and make it difficult for current to flow.
- 23. A continuity tester can be used to test for conductors and insulators.
- 24. Resistance is a measure of how difficult it is for the charges to move through an object.
- 25. The longer a wire the higher the resistance of the wire.

Voltage.

26. For most materials, as you increase the voltage the current increases.

- 27. Potential difference (p.d.) is often called voltage.
- 28. p.d. is the push that makes the charges move around a circuit.
- 29. Voltage is measured in volts.
- 30. Voltage is measured using a voltmeter, symbol V
- 31. Voltmeters are connected in parallel.

Drawing Circuits.

- 32. Circuit symbols are used to show how circuits can be built.
- 33. The circuit symbol for a cell, switch, bell, ammeter, voltmeter, lamp, power supply, resistor, wire, connected wire.
- 34. Make sure that you can draw circuits using the proper symbols and following the rules for drawing circuits.

Series and Parallel Circuits

- *35. The two types of circuit are called series and parallel.*
- 36. In series circuits the current is the same all round the circuit.
- 37. In parallel circuits the current splits up and some goes down each branch.
- *38. In series circuits the voltage across the components adds up to give the voltage of the supply.*
- 39. In parallel circuits the voltage is the same across each branch.
- 40. The current drawn from the supply increases the more components are connected in parallel.
- 41. When lamps are added in parallel the current drawn from the supply increases. This is because the overall resistance of the circuit is reduced.
- 42. I can help to design simple chemical cells and use them to investigate the factors which affect the voltage produced.

Additional Learning Outcomes

- 43. Using experimental evidence, I can place metals in an electrochemical series and can use this information to make predictions about their use in chemical cells. SCN 4-10a
- 44. Using a variety of sources, I have explored the latest developments in chemical cells technology and can evaluate their impact on society. SCN 4-10b

The Effects of a Current

45. The flow of electric current through a conductor produces several useful effects; heat, light, magnetism, and chemical effects.

Ohm's Law-

46. I can try the Ohms Law task, (a level 4 outcome and there is a sheet provided to help) This could form a Nat 4 or 5 outcome 1. V=IR (Voltage = current multiplied by voltage)
