Section 1 Road Safety

Learning Intentions & Success Criteria:

I am learning and can demonstrate how to travel safely.

I am learning to assess and manage risk, to protect myself and others, and to reduce the potential harm where possible.

I can persuade, argue, explore issues or express an opinion using relevant supporting detail and or evidence.

When listening and talking with others for different purposes, I can:

communicate information, ideas or opinions

explain processes, concepts or ideas

identify issues raised, summarise findings or draw conclusions.

I am learning the common road signs from the Highway Code.

I am learning the difference between a warning triangle sign and an order sign in a circle.

JAH

April 2020

WARNING

If you have problems with learning about Physics through ROAD SAFETY then PLEASE let your TEACHER KNOW a.s.a.p

JAH

April 2020

BACKGROUND

bbc news background

For an everyday activity, travelling by road is probably the riskiest thing many of us do on a regular basis.

On average, five people are killed every day on the roads in Great Britain. Hundreds more are injured, many of them seriously, often with life changing consequence.

In the past 10 years, the death toll has amounted to 18,314. As such road crashes are the largest single cause of accidental death for people aged between 5 and 35 years.

Check for yourself...

- <https://roadtraffic.dft.gov.uk/custom-downloads/road-accidents>

Select a group of road users, years, speed limits, type of road users and research to see if you can find out some of the following or your own queries

- On which roads do most road deaths occur?
- Which group of road user have the highest death toll?
- Which part of Great Britain has the highest injuries and why?
- Ask yourself some questions to answer

JAH

April 2020

10

Global Statistics

- ACROSS THE WORLD.....
- Nearly 1.25 million people die in road crashes each year, on average 3,287 deaths a day.
- An additional 20-50 million are injured or disabled.

Speed, Distance & Time

Learning Intentions and Success Criteria

- I know the definitions (meaning) of the words speed, distance, average speed.
- $average\ speed = \frac{total\ distance\ travelled}{time\ for\ the\ journey}$
- Average speed = total distance ÷ time
- $\bar{v} = \frac{d}{t}$
- I know that speed is given as the MAIN cause of FATAL ACCIDENTS on Scotland's Roads.

JAH

April 2020

26

Speed, Distance & Time

- I can find the mean average of several numbers using a calculator.
- I can find the average speed for a journey.
- I know that in Physics we show the divide by sign as a line and say "over"
- I can lay out equations using the acronym I.E.S.S.U.U.

JAH

Back to the future

April 2020

27

Important Notes

- No secs
- No STD's
- No p-ing (except in mph)
- No recur

JAH

April 2020

29

Word bank

- Distance- is how far you have travelled. It is another name for length. It is measured in metres or during our road safety topic miles.
- Time- the duration of the journey. It is measured in seconds or during our road safety topic hours.

JAH

April 2020

30

Speed

- Speed - the distance you travel every second.

OR

- Speed is the distance travelled in unit time.

- In Science distances are measured in metres and our time is measured in seconds so units of speed would be metres per second (m/s or ms⁻¹)
- In road safety we look at miles travelled every hour or miles per hour.

JAH

April 2020

Did you know?

- Excessive speed contributes to 12% of all injury collisions, 18% of crashes resulting in a serious injury and 28% of all fatal collisions.
- This means that around 1,000 people are killed each year on Britain's roads, and over 6,000 are seriously injured, because drivers and riders travel too fast.

Highway Code Rule 103
You MUST NOT exceed the maximum speed limits for the road and for your vehicle. Street lights usually mean that there is a 30 mph speed limit unless there are signs showing another limit.

What do you think?
Find out the normal speed limits for different types of roads and different vehicles. Why do some vehicles (for example, heavy goods vehicles) have lower limits?
Why are speed limits necessary? What would happen if drivers were allowed to drive at any speed they wanted? Would they all choose the same speed on a particular road? Would they choose speeds that were safe for pedestrians and cyclists?
How do higher speeds make crashes more likely? How do higher speeds make collisions more serious?

Speeding is not just exceeding the speed limit. It is also driving within the speed limit but too fast for the conditions (known as 'inappropriate speed'). Describe some situations where it is not safe to drive as fast as the speed limit.

Discussion Points

Stopping Distances
The faster a car is travelling, the longer it takes to stop. At just 30 mph, a car travels 44 feet (about 3 car lengths) each second.

Using the Highway Code, make a chart showing the differences in stopping distances between various speeds (in between 20 mph and 70 mph. If a driver reacts slowly, the stopping distance will increase. What else increases stopping distances?)

As well as being dangerous itself, going too fast also makes other types of driving more dangerous, e.g. driving too close to the vehicle in front. Make a list of types of bad driving that are made even worse at higher speeds.

32

Speed

The average speed is the distance travelled every second averaged for the whole journey.

Speed = total distance divided by the total journey time

$$\text{Speed} = \frac{\text{Distance}}{\text{Time}}$$

where
 \bar{v} = average speed (m/s)
 d = distance (m)
 t = time (s)

In Physics we show the divide by sign as a line and say "over"

The line over the v for speed means average

JAH

April 2020

HOW TO LAY OUT EQUATIONS IN PHYSICS

Before we can do any calculations on this you need to know how to lay out questions in Physics. This video is a little out of date, and your exam paper won't be written in Scots but you'll get the idea.

37

Work out the average speeds for the following journeys. Make sure you set out your working in the same way as the example above.

1. A boat travels 30 km in 3 hours.

2. A tractor drives 18 km in 6 hours.

3. A frog jumps 25 metres in 5 seconds.
(Take care with the units.)

4. A plane flies 600 km in 3 hours.

JAH

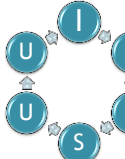

April 2020

Let's try some examples

1. A boat travels 30 km in 3 hours.

$$v = \frac{d}{t}$$
$$v = \frac{30}{3}$$
$$v = 10 \text{ km/h}$$

$$d = 30\text{km}$$
$$t = 3\text{h}$$
$$v = ?$$

JAH

April 2020

examples

2. A tractor drives 18 km in 6 hours.

$$v = \frac{d}{t}$$
$$v = \frac{18}{6}$$
$$v = 3 \text{ km/h}$$

$$d = 18\text{km}$$
$$t = 6\text{h}$$
$$v = ?$$

JAH

April 2020

3. A frog jumps 25 metres in 5 seconds.
(Take care with the units.)

$$\text{Speed} = \frac{\text{Distance}}{\text{Time}}$$
$$v = \frac{d}{t}$$
$$v = \frac{25}{5}$$
$$v = 5\text{m/s}$$

$$d = 25\text{m}$$
$$t = 5\text{s}$$
$$v = ?$$

JAH

April 2020

4. A plane flies 600 km in 3 hours.

$$v = \frac{d}{t}$$
$$v = \frac{600}{3}$$
$$v = 200 \text{ km/h}$$

$$d = 600\text{km}$$
$$t = 3\text{h}$$
$$v = ?$$

JAH

April 2020

Answer = 17.5 m/s Average speed = 17.5 m/s Distance = 100 metres Time = 6 seconds	Specfic marking	Answer = 5s Average speed = 5 m/s Distance = 100 metres Time = 20 seconds	Specfic marking

73

Safety

Section 6

Stopping Distance

Learning Intentions

- The distance that a car travels during the driver's reaction time is called the Thinking Distance.
- The distance a vehicles travels during braking is called the braking distance
- The STOPPING DISTANCE of a car is made up of TWO parts: THINKING DISTANCE and BRAKING DISTANCE.
- Stopping distance= thinking distance + braking distance.
- I can identify things that affect, thinking distance and braking distance, all of which will change the stopping distance.

JAH

April 2020

74

Revision

- State the meaning of the signs shown
- Convert 48 mins into parts of an hour
- Mr Asher cycled 502 miles in 6 days, cycling for 5 hours a day, calculate his average speed in mph
- State the 4 things you mustn't use in Physics when doing calculations.

JAH

April 2020

75

The STOPPING DISTANCE of a car is made up of TWO parts

•THINKING DISTANCE

Thinking distance is the distance a car will travel in the time it takes you to react to the situation.

•BRAKING DISTANCE

The distance the car will travel as the brakes are applied

JAH

April 2020

76

Stopping distance = thinking + braking distance distance

Stopping distance the distance it takes a vehicle to stop.

JAH

April 2020

 Did you know? A pedestrian hit by a car at:

- 20 mph, has a 97% chance of surviving (almost all live)
- 30 mph, has a 80% chance of surviving (most live)

- 35 mph, has a 50% chance of surviving (half live, half die)
- 40 mph, has only a 10% chance of surviving (almost all die).

Small increases in speed have massive effects

Speed	Thinking Distance	Braking Distance	Total Stopping Distance
20 mph	4 metres	12 metres (30 feet) or 3 car lengths	16 metres
30 mph	9 metres	24 metres (75 feet) or 6 car lengths	33 metres
40 mph	12 metres	36 metres (120 feet) or 9 car lengths	48 metres
50 mph	17 metres	53 metres (175 feet) or 13 car lengths	70 metres
60 mph	21 metres	73 metres (240 feet) or 18 car lengths	94 metres
70 mph	27 metres	96 metres (315 feet) or 24 car lengths	123 metres

April 2020

JAH

11

 Stopping Times Example

Click to enlarge!

Here's a good example. A car driver sees a family of ducks crossing the road in front of her. She brakes for 1.5 s and took 1.8 s to stop. What is her reaction time?

The total stopping time was 1.8 s. This is made of two parts: thinking and braking. The braking time was 1.5 s, so the thinking (reaction) time was 0.3 s.

By the way, she stopped in time - lucky she wasn't driving too fast!

Measuring Instantaneous Speed Using A Stopwatch

What you need

- Model vehicle, ruler, chalk, stopclock.

What to do

- Mark one chalk line/ white board marker on the bench. (Don't forget to rub it out when you have finished!).
- Measure the length of the model vehicle. Record this in your jotter.
- Push the car and time how long it takes the car to fully pass the line.

JAH

April 2020

What to do

- Mark a chalk line/ white board marker line on the bench. (Don't forget to rub it out when you have finished!).
- Measure the length of the model vehicle. Record this in your jotter.
- Push the car and time how long it takes the car to fully pass the line.
 - Start the stopclock when the front edge of the vehicle reaches the chalk line.
 - Stop the stopclock when the end of the car reaches the chalk line.
 - Note the time from the stopclock in your jotter.
- Calculate the speed using the formula:

$$\text{speed} = \frac{\text{distance}}{\text{time}}$$

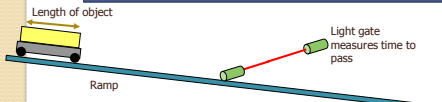

JAH

April 2020

Instantaneous Speed Using Light

Another way to measure instantaneous speed is to use a light gate. The **length of the object** divided by the **time it takes to pass** gives its instantaneous speed.

$$\text{instantaneous speed} = \frac{\text{length}}{\text{time to pass a point}}$$

Length of object
Ramp
Light gate measures time to pass

April 2020 JAH 91

Measuring Your Instantaneous Speed Trap

1. Set up a “speed trap” on the playmat.
2. Open the ALBA programme and open the “Motion -Introduction to Speed” program
3. Measure the length of the mask on top of your vehicle.
4. Record the time for the vehicle to pass through the light gate.
5. Record the instantaneous speed of the vehicle.

JAH April 2020

INSTANTANEOUS SPEED- Road Safe

Speed Cameras in D&G

April 2020 JAH 93

Speed cameras

Cameras are used to discourage drivers from exceeding the speed limit.

Using the websites www.dli.gov.uk (click on Road Safety and then Safety Cameras) and www.nationalhighways.gov.uk find out the rules for placing speed cameras. On a road map, mark the locations of cameras in your area. Why do you think they are where they are?

Write an article describing how cameras work, why they are needed and how effective they are. This could be for a local newspaper. Could you use quotes or statements from family members or friends about their views.

Cars

What features of car design help drivers to control their speed? Do any aspects of car design encourage drivers to go too fast? Also think about how cars are advertised and promoted. What sort of adverts would influence your choice of car and why? What else could manufacturers do to help drivers?

Most speedometers are a dial with numbers around the edge and an arrow pointing towards the speed the vehicle is doing. Is this the best design? Are there other types?

Design a new speedometer. Think about how it tells the driver what speed they are doing and how it could warn him or her if they are going too fast.

Cars towing caravans or trailers (including car derived vans and motorcycles)	30	50	60	60
Buses and coaches (not exceeding 12 metres in overall length)	30	50	60	70
Goods vehicles (not exceeding 7.5 tonnes maximum laden weight)	30	50	60	70**
Goods vehicles (exceeding 7.5 tonnes maximum laden weight)	30	40	50	60

These are the national speed limits and apply to all roads unless

JAH April 2020 95

96

These are the national speed limits and apply to all roads unless signs show otherwise.

* The 30 mph limit applies to all traffic on all roads in England and Wales (only Class C and unclassified roads in Scotland) with street lighting unless signs show otherwise.

** 60 if articulated or towing a trailer.

Built up areas generally have roads with street lights. Unless signed otherwise, the speed limit is always 30mph, no matter the number of lanes.

Single carriageway is an undivided road with no centre barrier.

Dual carriageway is a two way divided road with a central barrier that you are able to cross from side roads.

Motorway is a two way divided road with a central barrier containing slip roads. It is only possible to access a motorway via slip roads and there is no crossway traffic.

JAH April 2020

Activities

There are many reasons and excuses for speeding (such as "I was late", "everyone else does it" and "I enjoy driving fast").

In a pair:

- Make a list of all the reasons you can think of.
- Create a questionnaire (example opposite).
- Ask people you know who drive (parents, their friends, teachers, etc.) to complete the questionnaire.
- Keep the questionnaires anonymous, but record whether the respondents are male or female and their age.
- Collate all the responses together.

Speeding Questionnaire

Produce a report analysing the results and identifying the most common reasons for speeding and any differences between men and women and between age groups.

Respondent 1	Male	Female	Age	
Reason for Speeding	Never	Sometimes	Often	Always
Late				
Other drivers speeding				
I think it's safe to speed				

Discussion Points

In small groups:

- Brainstorm the best ways of raising awareness about the dangers of speeding.
- What methods would you use e.g. TV adverts, posters, something else?
- Where would you target publicity? (locations/events)

April 2020 JAH

97

Activities

Design an awareness raising campaign to include a leaflet, poster and press release.

Who do you think are the key target groups? Think about age, sex, and also social activities. Also take into consideration these locations and times where speeding is more common. Decide whether to cover all drivers or a specific group (does your decision change the method you would use, your target group or where you would locate the campaign?).

Think about campaigns used by other groups and try to make yours effective for your target audience. Run your campaign either in school or in your local community, make sure that you establish a way to evaluate the success of the campaign. Set a time limit for the campaign, this could be a couple of days or a week or more. You will need to draw up a plan of action to ensure the smooth running of the campaign and source all the materials that you need to set it up. Have you ever been a passenger in a car and been concerned that the driver is going too fast? Look at www.bbc.com/news/health-123456 to see how one group of young people have dealt with this issue.

Take it further...

Did you know?

In 2004 a survey of vehicle speeds in Britain:

- 55% of car drivers exceed the speed limit on 50 mph roads in built-up areas.
- On 40 mph roads, 17% of car drivers exceed the speed limit.
- On motorways, 56% of car drivers exceed the speed limit.
- On dual carriageways if they built up more, drivers of car drivers exceed the speed limit.
- 48% of motorcyclists exceed the speed limit on 50 mph roads in built-up areas.

Activities

In the future, cars may not be able to exceed the speed limit. Using the Useful Links section, find out about Intelligent Speed Adaptation (ISA). Organise a class debate. Have one or two people to speak for and against the motion "This class calls for all cars to be fitted with technology to stop them exceeding the speed limit". Think about the advantages and disadvantages of taking the control away from the driver. What is best for society?

102

Section 9

Uniform/ Constant/ Steady Speed

Learning Intention
Uniform speed is when the speed remains constant and doesn't change for all or part of the journey.

JAH

Back to the 100s

103

Revision

1. State the meaning of the word instantaneous speed.
2. Why is it difficult to measure instantaneous speed?
3. State the equation for instantaneous speed.
4. What instrument in the car measures your instantaneous speed?
5. If Mrs Bowker cycled from Lockerbie to Dalkeith, a distance of 107 km and this takes 4 hours 16 mins, calculate her average speed.

JAH

April 2020

104

Uniform/constant/steady Speed

Uniform/ constant/ steady Speed

Sometimes through the whole journey your speed will not change. This could be because you have cruise controls on. We would say that your speed is UNIFORM when your speed isn't changing. It remains constant.

$$\text{Uniform speed} = \frac{\text{distance travelled}}{\text{time for the journey}}$$

JAH

April 2020

105

Uniform Speed /constant speed/ steady speed

When your speed is uniform we mean that your speed isn't changing. It remains constant or steady

$$\text{Uniform speed} = \frac{\text{distance travelled}}{\text{time for the journey}}$$

JAH

April 2020

Uniform speed

Do you think people often travel at a uniform speed?

Discuss times when the speed might be uniform and when it might not be uniform.

WHY?

JAH

April 2020

106

107

$$\text{average speed} = \frac{\text{total distance travelled}}{\text{time for the whole journey}}$$

$$\text{instantaneous speed} = \frac{\text{length}}{\text{time to pass a point}}$$

$$\text{Uniform speed} = \frac{\text{distance travelled}}{\text{time for the journey}}$$

Section 10

108

displacement & velocity

Learning Intentions

- **Velocity** = **Displacement** ÷ **Time**
- Displacement is the direct distance from the start of your journey to the end is a certain direction.
- Velocity is the displacement covered during the journey divided by the time taken. It is measured in metres per second m/s. You must quote a direction when writing down a velocity

JAH

April 2020

Revision

Distance = “how far we’ve travelled”

- ⇒ symbol d
- ⇒ units metres, m

And later we’ll show distance is....

- ⇒ (scalar quantity
(the magnitude and unit fully describes this quantity)

April 2020 JAH

109

Displacement = “how far we’ve travelled in a straight line (from A to B)” (include your direction)

- ⇒ symbol s
- ⇒ units, metres, m
- ⇒ Vector quantity
- ⇒ Must quote the direction

REVIEW

127

REVIEW

WHAT ARE DISTANCE AND DISPLACEMENT?

Distance is length. How far you've travelled (e.g. 100 metres)

Displacement is direct distance in a particular direction (e.g. 100 metres to the right)

WHAT ARE SPEED AND VELOCITY?

Speed is the rate of covering a distance (e.g. 50km/h)

Velocity is rate of displacement in a particular direction (e.g. 50 km/h north)

JAH

Virtual Int 2 Physics

Adding vectors

When two or more scalar quantities are added together the result is simply the arithmetic sum of each. For example a mass of 4 kg and one of 3 kg, when added make a mass of 7 kg.

When two or more vector quantities are added, provided they act in the same direction, the addition is quite straightforward. A force of 4 N to the right is added to a second force of 3 N to give a resultant force of 7 N to the right.

The addition of two or more vectors is called the resultant.

The situation becomes a little bit more complicated if the second force is directed to the left. Now we must remember that vectors can be positive or negative.

The resultant is 4 N + (-3) N which is 1 N to the right.

Notice how we represent a vector by a line with an arrow.

The LENGTH of the line represents the SIZE of the vector, for example we could use 1 cm to represent 1 N. The DIRECTION of the line must be parallel to the vector direction AND point in the correct direction. Notice that the -3 N force above has the arrow pointing to the left.

When giving the answer to a vector problem you MUST give both the size (magnitude) and direction.

Virtual Int 2 Physics

Adding vectors (2)

The resultant of two or more forces which act at an angle to each other can be found by drawing a vector diagram. Consider the example below where two forces act on an object as shown.

A vector diagram is drawn by taking each of the vectors in turn and joining them HEAD to TAIL.

The line from the tail of the first vector to the head of the last represents the resultant.

The size and direction of the resultant can be found by drawing the vectors to scale, for example using 1 cm for 1 N, then measuring the size of the resultant with a ruler AND then measuring the angle with a protractor.

Alternatively Pythagoras Theorem can be used to find the size of the resultant, when the two vectors are at 90°. The angle can be calculated using trigonometry, for example $\tan(\theta) = \frac{F_2}{F_1}$.
